

Smile

Make a class, Smile.java, which constructs a smiley face (no hardcoding). The first part consists of making a smiley face by reading the size from a file, and the second part by getting information from the map alone.

- File name will be “smilesizesize.txt”
- “go_file()” method reads smile size from file and constructs smile
- “go_map()” method constructs the biggest conventional* smile within the map
- Maps under Smile folder (8x8, 10x10, 12x12, etc)
- Do a victory lap around the map at the end

*Conventional meaning the smile does not touch the edges of the map (wall)

Smiley faces - (8x8, 10x10, 12x12, 14x14):

Specification

Submit the file “Smile.java” to the provided link and be prepared to explain your code to the teacher and show them that there is no hardcoding involved.
